When working with machine learning, it's easy to try them all out without understanding what each model does, and when to use them. In this cheat sheet, you'll find a handy guide describing the most widely used machine learning models, their advantages, disadvantages,

and some key use-cases.

Top Machine Learning Algorithms

datacamp

		ALGORITHM	DESCRIPTION	APPLICATIONS	ADVANTAGES	DISADVANTAGES
Supervised Learning	Linear Models	Linear Regression	A simple algorithm that models a linear relationship between inputs and a continuous numerical output variable	USE CASES <ol style="list-style-type: none"> 1. Stock price prediction 2. Predicting housing prices 3. Predicting customer lifetime value 	ADVANTAGES <ol style="list-style-type: none"> 1. Explainable method 2. Interpretable results by its output coefficients 3. Faster to train than other machine learning models 	DISADVANTAGES <ol style="list-style-type: none"> 1. Assumes linearity between inputs and output 2. Sensitive to outliers 3. Can overfit with small, high-dimensional data
		Logistic Regression	A simple algorithm that models a linear relationship between inputs and a categorical output (1 or 0)	USE CASES <ol style="list-style-type: none"> 1. Credit risk score 2. Customer churn prediction 	ADVANTAGES <ol style="list-style-type: none"> 1. Interpretable and explainable 2. Less prone to overfitting when using regularization 3. Applicable for multi-class predictions 	DISADVANTAGES <ol style="list-style-type: none"> 1. Assumes linearity between inputs and outputs 2. Can overfit with small, high-dimensional data
		Ridge Regression	Part of the regression family — it penalizes features that have low predictive outcomes by shrinking their coefficients closer to zero. Can be used for classification or regression	USE CASES <ol style="list-style-type: none"> 1. Predictive maintenance for automobiles 2. Sales revenue prediction 	ADVANTAGES <ol style="list-style-type: none"> 1. Less prone to overfitting 2. Best suited where data suffers from multicollinearity 3. Explainable & interpretable 	DISADVANTAGES <ol style="list-style-type: none"> 1. All the predictors are kept in the final model 2. Doesn't perform feature selection
		Lasso Regression	Part of the regression family — it penalizes features that have low predictive outcomes by shrinking their coefficients to zero. Can be used for classification or regression	USE CASES <ol style="list-style-type: none"> 1. Predicting housing prices 2. Predicting clinical outcome based on health data 	ADVANTAGES <ol style="list-style-type: none"> 1. Less prone to overfitting 2. Can handle high-dimensional data 3. No need for feature selection 	DISADVANTAGES <ol style="list-style-type: none"> 1. Can lead to poor interpretability as it can keep highly correlated variables
	Tree-Based Models	Decision Tree	Decision Tree models make decision rules on the features to produce predictions. It can be used for classification or regression	USE CASES <ol style="list-style-type: none"> 1. Customer churn prediction 2. Credit score modeling 3. Disease prediction 	ADVANTAGES <ol style="list-style-type: none"> 1. Explainable and interpretable 2. Can handle missing values 	DISADVANTAGES <ol style="list-style-type: none"> 1. Prone to overfitting 2. Sensitive to outliers
		Random Forests	An ensemble learning method that combines the output of multiple decision trees	USE CASES <ol style="list-style-type: none"> 1. Credit score modeling 2. Predicting housing prices 	ADVANTAGES <ol style="list-style-type: none"> 1. Reduces overfitting 2. Higher accuracy compared to other models 	DISADVANTAGES <ol style="list-style-type: none"> 1. Training complexity can be high 2. Not very interpretable
		Gradient Boosting Regression	Gradient Boosting Regression employs boosting to make predictive models from an ensemble of weak predictive learners	USE CASES <ol style="list-style-type: none"> 1. Predicting car emissions 2. Predicting risk rating for loan amount 	ADVANTAGES <ol style="list-style-type: none"> 1. Better accuracy compared to other regression models 2. It can handle multicollinearity 3. It can handle non linear relationships 	DISADVANTAGES <ol style="list-style-type: none"> 1. Sensitive to outliers and can therefore cause overfitting 2. Computationally expensive and has high complexity
		XGBoost	Gradient Boosting algorithm that is efficient & flexible. Can be used for both classification and regression tasks	USE CASES <ol style="list-style-type: none"> 1. Churn prediction 2. Claims processing in insurance 	ADVANTAGES <ol style="list-style-type: none"> 1. Provides accurate results 2. Captures non linear relationships 	DISADVANTAGES <ol style="list-style-type: none"> 1. Hyperparameter tuning can be complex 2. Does not perform well on sparse datasets
		LightGBM Regressor	A gradient boosting framework that uses a tree based learning algorithm. LightGBM is designed to be more efficient than other implementations	USE CASES <ol style="list-style-type: none"> 1. Predicting flight time for airlines 2. Predicting cholesterol levels based on health data 	ADVANTAGES <ol style="list-style-type: none"> 1. Can handle large amounts of data 2. Computational efficient & fast training speed 3. Low memory usage 	DISADVANTAGES <ol style="list-style-type: none"> 1. Can overfit due to leaf-wise splitting and high sensitivity 2. Hyperparameter tuning can be complex
		Unsupervised Learning	Clustering	K-Means	K-Means is the most widely used clustering approach—it determines K clusters based on euclidean distances	USE CASES <ol style="list-style-type: none"> 1. Customer segmentation 2. Recommendation systems
Hierarchical Clustering	A "bottom-up" approach where each data point is treated as its own cluster—and then the closest two clusters are merged together iteratively			USE CASES <ol style="list-style-type: none"> 1. Fraud detection 2. Document clustering based on similarity 	ADVANTAGES <ol style="list-style-type: none"> 1. There is no need to specify the number of clusters 2. The resulting dendrogram is informative 	DISADVANTAGES <ol style="list-style-type: none"> 1. Doesn't always result in the best clustering 2. Not suitable for large datasets due to high complexity
Gaussian Mixture Models	A probabilistic model for modeling normally distributed clusters within a dataset		USE CASES <ol style="list-style-type: none"> 1. Customer segmentation 2. Recommendation systems 	ADVANTAGES <ol style="list-style-type: none"> 1. Computes a probability for an observation belonging to a cluster 2. Can identify overlapping clusters 3. More accurate results compared to K-means 	DISADVANTAGES <ol style="list-style-type: none"> 1. Requires complex tuning 2. Requires setting the number of expected mixture components or clusters 	
Association	Apriori algorithm		Rule based approach that identifies the most frequent itemset in a given dataset where prior knowledge of frequent itemset properties is used	USE CASES <ol style="list-style-type: none"> 1. Product placements 2. Recommendation engines 3. Promotion optimization 	ADVANTAGES <ol style="list-style-type: none"> 1. Results are intuitive and interpretable 2. Exhaustive approach as it finds all rules based on the confidence and support 	DISADVANTAGES <ol style="list-style-type: none"> 1. Can generate many uninteresting itemsets 2. Computationally and memory intensive 3. Results in many overlapping item sets

Supervised Learning

Supervised learning models are models that map inputs to outputs, and attempt to extrapolate patterns learned in past data on unseen data. Supervised learning models can be either regression models, where we try to predict a continuous variable, like stock prices—or classification models, where we try to predict a binary or multi-class variable, like whether a customer will churn or not. In the section below, we'll explain two popular types of supervised learning models: linear models, and tree-based models.

Linear Models

In a nutshell, linear models create a best-fit line to predict unseen data. Linear models imply that outputs are a linear combination of features. In this section, we'll specify commonly used linear models in machine learning, their advantages, and disadvantages.

Algorithm	Description	Applications	Advantages	Disadvantages
Linear Regression	A simple algorithm that models a linear relationship between inputs and a continuous numerical output variable	<ol style="list-style-type: none">1. Stock Price Prediction2. Predicting housing prices3. Predicting customer lifetime value	<ol style="list-style-type: none">1. Explainable method2. Interpretable results by its output coefficient3. Faster to train than other machine learning models	<ol style="list-style-type: none">1. Assumes linearity between inputs and output
				<ol style="list-style-type: none">2. Sensitive to outliers3. Can underfit with small, high-dimensional data
Logistic Regression	A simple algorithm that models a linear relationship between inputs and a categorical output (1 or 0)	<ol style="list-style-type: none">1. Predicting credit risk score2. Customer churn prediction	<ol style="list-style-type: none">1. Interpretable and explainable2. Less prone to overfitting when using regularization3. Applicable for multi-class predictions	<ol style="list-style-type: none">1. Assumes linearity between inputs and outputs
				<ol style="list-style-type: none">2. Can overfit with small, high-dimensional data

Ridge Regression	Part of the regression family — it penalizes features that have low predictive outcomes by shrinking their coefficients closer to zero. Can be used for classification or regression	<ol style="list-style-type: none"> 1. Predictive maintenance for automobiles 2. Sales revenue prediction 	<ol style="list-style-type: none"> 1. Less prone to overfitting 2. Best suited where data suffer from multicollinearity 3. Explainable & interpretable 	<ol style="list-style-type: none"> 1. All the predictors are kept in the final model 2. Doesn't perform feature selection
Lasso Regression	Part of the regression family — it penalizes features that have low predictive outcomes by shrinking their coefficients to zero. Can be used for classification or regression	<ol style="list-style-type: none"> 1. Predicting housing prices 2. Predicting clinical outcomes based on health data 	<ol style="list-style-type: none"> 1. Less prone to overfitting 2. Can handle high-dimensional data 3. No need for feature selection 	<ol style="list-style-type: none"> 1. Can lead to poor interpretability as it can keep highly correlated variables

Tree-based models

In a nutshell, tree-based models use a series of "if-then" rules to predict from decision trees. In this section, we'll specify commonly used linear models in machine learning, their advantages, and disadvantages.

Algorithm	Description	Applications	Advantages	Disadvantages
-----------	-------------	--------------	------------	---------------

Decision Tree	Decision Tree models make decision rules on the features to produce predictions. It can be used for classification or regression	<ol style="list-style-type: none"> 1. Customer churn prediction 2. Credit score modeling 3. Disease prediction 	<ol style="list-style-type: none"> 1. Explainable and interpretable 2. Can handle missing values 	<ol style="list-style-type: none"> 1. Prone to overfitting 2. Sensitive to outliers
Random Forests	An ensemble learning method that combines the output of multiple decision trees	<ol style="list-style-type: none"> 1. Credit score modeling 2. Predicting housing prices 	<ol style="list-style-type: none"> 1. Reduces overfitting 2. Higher accuracy compared to other models 	<ol style="list-style-type: none"> 1. Training complexity can be high 2. Not very interpretable
Gradient Boosting Regression	Gradient Boosting Regression employs boosting to make predictive models from an ensemble of weak predictive learners	<ol style="list-style-type: none"> 1. Predicting car emissions 2. Predicting ride-hailing fare amount 	<ol style="list-style-type: none"> 1. Better accuracy compared to other regression models 2. It can handle multicollinearity It can handle non-linear relationships 	<ol style="list-style-type: none"> 1. Sensitive to outliers and can therefore cause overfitting 2. Computationally expensive and has high complexity

XGBoost	Gradient Boosting algorithm that is efficient & flexible. Can be used for both classification and regression tasks	<ol style="list-style-type: none"> 1. Churn prediction 2. Claims processing in insurance 	<ol style="list-style-type: none"> 1. Provides accurate results 2. Captures non-linear relationships 	<ol style="list-style-type: none"> 1. Hyperparameter tuning can be complex 2. Does not perform well on sparse datasets
LightGBM Regressor	A gradient boosting framework that is designed to be more efficient than other implementations	<ol style="list-style-type: none"> 1. Predicting flight time for airlines 2. Predicting cholesterol levels based on health data 	<ol style="list-style-type: none"> 1. Can handle large amounts of data 2. Computational efficient & fast training speed 3. Low memory usage 	<ol style="list-style-type: none"> 1. Can overfit due to leaf-wise splitting and high sensitivity 2. Hyperparameter tuning can be complex

Unsupervised Learning

Unsupervised learning is about discovering general patterns in data. The most popular example is clustering or segmenting customers and users. This type of segmentation is generalizable and can be applied broadly, such as to documents, companies, and genes. Unsupervised learning consists of clustering models, that learn how to group similar data points together, or association algorithms, that group different data points based on pre-defined rules.

Clustering models

Algorithm	Description	Applications	Advantages	Disadvantages

K-Means	K-Means is the most widely used clustering approach—it determines K clusters based on euclidean distances	<ol style="list-style-type: none"> 1. Customer segmentation 2. Recommendation systems 	<ol style="list-style-type: none"> 1. Scales to large datasets 2. Simple to implement and interpret 3. Results in tight clusters 	<ol style="list-style-type: none"> 1. Requires the expected number of clusters from the beginning 2. Has troubles with varying cluster sizes and densities
Hierarchical Clustering	A "bottom-up" approach where each data point is treated as its own cluster—and then the closest two clusters are merged together iteratively	<ol style="list-style-type: none"> 1. Fraud detection 2. Document clustering based on similarity 	<ol style="list-style-type: none"> 1. There is no need to specify the number of clusters 2. The resulting dendrogram is informative 	<ol style="list-style-type: none"> 1. Doesn't always result in the best clustering 2. Not suitable for large datasets due to high complexity

Gaussian Mixture Models	A probabilistic model for modeling normally distributed clusters within a dataset	<ol style="list-style-type: none"> 1. Customer segmentation 2. Recommendation systems 	<ol style="list-style-type: none"> 1. Computes a probability for an observation belonging to a cluster 2. Can identify overlapping clusters 3. More accurate results compared to K-means 	<ol style="list-style-type: none"> 1. Requires complex tuning 2. Requires setting the number of expected mixture components or clusters
--------------------------------	---	---	---	---

Association

Algorithm	Description	Applications	Advantages	Disadvantages
Apriori Algorithm	Rule based approach that identifies the most frequent itemset in a given dataset where prior knowledge of frequent itemset properties is used	<ol style="list-style-type: none"> 1. Product placements 2. Recommendation engines 3. Promotion optimization 	<ol style="list-style-type: none"> 1. Results are intuitive and Interpretable 2. Exhaustive approach as it finds all rules based on the confidence and support 	<ol style="list-style-type: none"> 1. Generates many uninteresting itemsets 2. Computationally and memory intensive. Results in many overlapping item sets
